

i.idro DRAIN, the draining solution for continuous pavements

i.idro DRAIN is an innovative concrete formulation capable of draining water.

Thanks to a specially formulated mix, **i.idro DRAIN** combines the strength of a concrete pavement with a drainage capacity being 100 times greater than that of natural soil. **i.idro DRAIN** is one of the most environmentally sustainable products on the market today.

i.idro DRAIN returns rain and stormwater to the ground thus replenishing aquifers and allowing water conveyance through special sub-service drain pipes. Unlike draining asphalt concrete pavements, **i.idro DRAIN** contains neither oils nor other polluting agents.

The product is available bagged or delivered bulk by truck mixers. Its drainage capacity varies as a function of the particle size distribution adopted for its formulation.

i.idro DRAIN can be formulated with TX Active, the innovative photocatalytic principle for cement-based products, developed and patented by Italcementi Group.

i.idro DRAIN is just one out of the many products stemming from Italcementi Group's continued commitment to developing innovative solutions for architecture and the construction industry.
